

Query Manager

Thank you for downloading Query Manager.

Please note, this application does not make changes to the data in the database directly. The database user created below is done in order to read from the database. This is no different to your rights as a database administrator working with SQL Server. Query Manager makes all its changes through the Raiser's Edge API. However it is always advisable to make regular backups of your database and to make sure that there is a recent back up before making any large changes.

Installation:

1. Unzip the downloaded file and run the setup.exe file from within the Client folder. This will put all the required files in the correct place
2. On your Raiser's Edge database server run the ZDServerInstall.exe application. You will need to be logged into the server as a user that has rights to the SQL Server database to create users.
3. Follow the wizard and make a note of the user name and password that you created. You will need this the first time you run the application.

For more information about the server installer please download instruction for the Zeidman Development Universal Server Installer from our website:
